

How Infraon equipped Baldor Technologies Pvt. Ltd with advanced asset management capabilities

Challenges

- Extensive usage of spreadsheets
- No real-time tracking of assets and usage
- Lot of manual work during auditing
- Manual approval process for asset purchase/allocation

Why Infraon?

- Fast implementation of Infraon Assets – a fully integrated SaaS asset management module
- Inventory agent installation and the data it collects
- Barcode or QR code scanning and printing
- Asset allocation and approval workflow
- Ease of use and user experience

Results

- 25% - 50% increased agent productivity
- 25% - 50% improvement in organization compliance
- < 25% saved cost on IT spent annually

About the client

BaldorTech, an emerging start-up based in India, is poised to transform the recruitment industry. Established by experienced professionals who have led various organizations across multiple sectors, both small and large, the company specializes in HR analytics and decision-making platform services. Baldor Technologies also offers services in financial risk management, human resources, and the sharing economy, catering primarily to customers within India.

The need

The client relied on spreadsheets for managing asset management-related tasks, which led to several operational challenges. The lack of real-time tracking capabilities meant there was no instant visibility into asset status or usage. The absence of real-time data was challenging during audit periods, where the team faced a substantial amount of manual work to verify and reconcile asset records.

Hence, the client wanted to shift from the manual process for approving new asset purchases or allocating existing ones. It would also mean the asset management system was no longer prone to errors. That way, procurement delays and inefficiencies in asset utilization were a thing of the past. Basically, the client required a solution that could automate these processes, streamline asset management, and improve real-time data accessibility to enhance decision-making.

Solution

Infraon Assets, a fully integrated SaaS asset management module, was quickly deployed to address the client's challenges with manual processes. It helped create a major improvement in managing the complete asset lifecycle.

Infraon Assets came with a feature that automated the collection of detailed asset data. It was crucial for gathering extensive information on each asset, such as specifications, configurations, and operational data, which were updated in real time in the system's database. The module supported barcode and QR code functionality, which simplified the process of tracking and updating asset information.

Infraon Assets also transformed the process of asset allocation and approval by automating these workflows. It accelerated the procedures for requesting and approving new assets, thus streamlining what was previously a time-consuming process that involved multiple steps.

The module's user-friendly interface and operational simplicity enhanced productivity, making asset management tasks a lot more manageable.

Benefits

- 25% - 50% increased agent productivity due to streamlined workflows
- 25% - 50% improvement in organization compliance, thanks to better tracking and management capabilities
- >25% saved cost on IT spent annually driven by seamless automation and process optimization
