infraon

How Infraon deployed an asset management module for Healthium to improve daily operations

Challenges

- Lack of real-time tracking of assets and their usage
- Lot of manual work during auditing
- Unable to track software licenses and incurred expenses

Why Infraon?

- Deployment of Infraon Asset Management - a SaaS-based module
- Quick inventory agent installation and the data it collects
- Bulk asset onboarding using IT and fixed assets
- Software license management

Results

- 50% - 75% more agent productivity
- 50% - 75% organization compliance improvement
- 50% - 75% annual IT cost savings

About the client

Healthium Medtech Limited is a leading global medtech company specializing in surgical, post-surgical, and chronic care products. Their portfolio cuts across several segments, including Advanced Surgery, Advanced Wound Care, Arthroscopy, and Infection Prevention. Healthium is the first Indian medtech company to achieve CE certification under the new EU-MDR norms for Class III implants. They are also the largest non-captive surgical needles manufacturer by volume worldwide, ranking as the fourth largest suture manufacturer globally. Currently, they serve customers in more than 90 countries around the world.

The need

The client required a module that enabled real-time tracking of assets for effortless management and utilization. It should allow for immediate visibility into the status and deployment of assets across the organization, which is critical for optimizing resource usage and reducing unnecessary expenditures.

There was also a demand for automating the auditing process to reduce the reliance on manual tasks. This would streamline the auditing operations, minimize the potential for errors and increase the accuracy of audit reports. Additionally, the client sought a method to track software licenses and related expenses to improve financial oversight and compliance.

Solution

The module included installing an inventory agent capable of collecting extensive data on each asset within the client's organization. The agent automatically documented important details such as asset specifications, locations, usage patterns, and maintenance schedules. By capturing this information, the system provided the organization with valuable insights into asset performance and operational status.

Infraon Assets also came with an automated process for bulk asset onboarding, which streamlined the integration of IT and fixed assets into the organization's existing inventory. It allowed for a faster onboarding of new assets, thereby reducing the time and labor involved in manual entries.

The module featured an advanced software license management system to track the allocation, usage, and expenditures, enabling the client to maintain compliance with licensing agreements and manage costs.

Benefits

- 50% - 75% boost in agent productivity with streamlined workflows and reduced manual tasks
- 50% - 75% higher organization compliance, ensuring adherence to industry regulations and standards
- 50% - 75% annual IT cost savings, significantly lowering overall business expenditures
